Rise and run of an interval

PRACTICE

NAME _____ DATE _____

EXAMPLE **Find the rise and run of the interval PQ.**

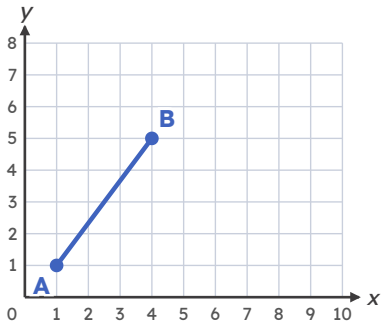

1. Draw a right-angled triangle with the interval as its longest side.
2. **Run:** count the squares **across** from one end to the other.
3. **Rise:** count the squares **up or down** from one end to the other.
4. Rise and run are lengths, so they are **never negative**.

Rise = 3 units, run = 4 units

YOU DO **Questions 1–6: draw the triangle, then find the rise and run of each interval.**

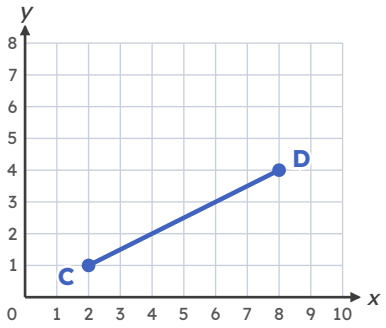

REMEMBER Count squares across for the run, and up or down for the rise.

1

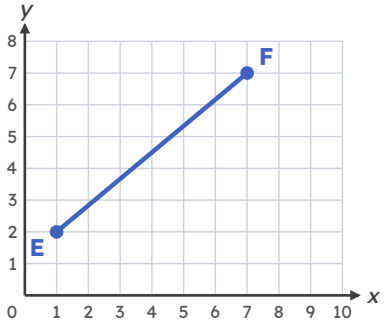

Rise = _____ Run = _____

2

Rise = _____ Run = _____

3

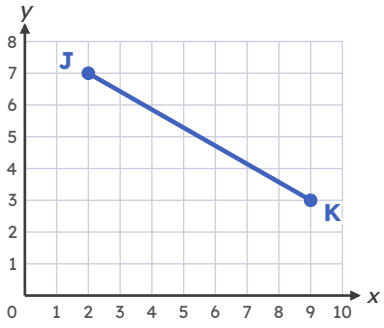

Rise = _____ Run = _____

4

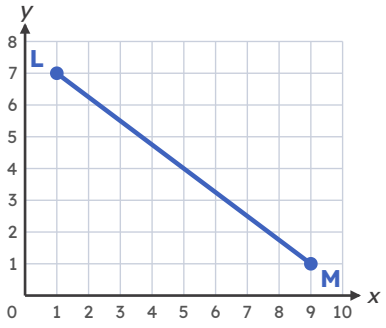

Rise = _____ Run = _____

5

Rise = _____ Run = _____

6

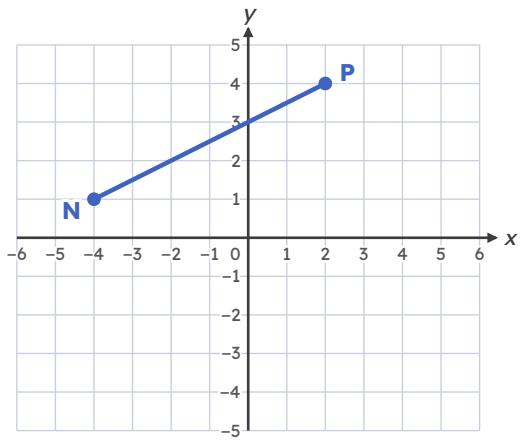

Rise = _____ Run = _____

YOU DO Questions 7–12: these intervals cross the axes. Find the rise and run of each interval.

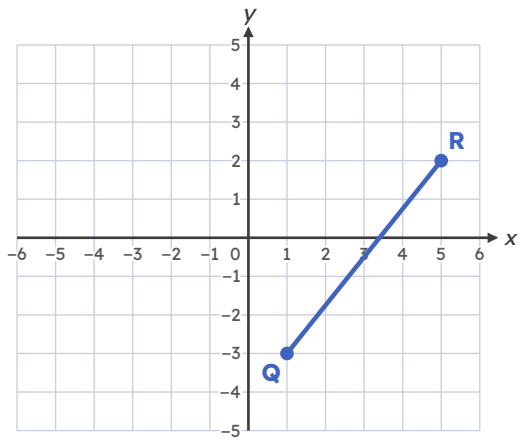

REMEMBER Count the squares, not the numbers on the axes. A rise or run is never negative.

7

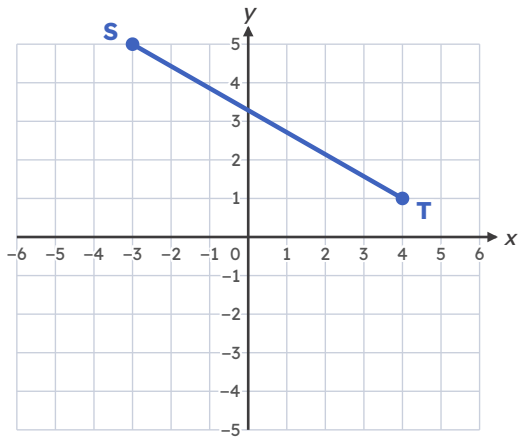

Rise = _____ Run = _____

8

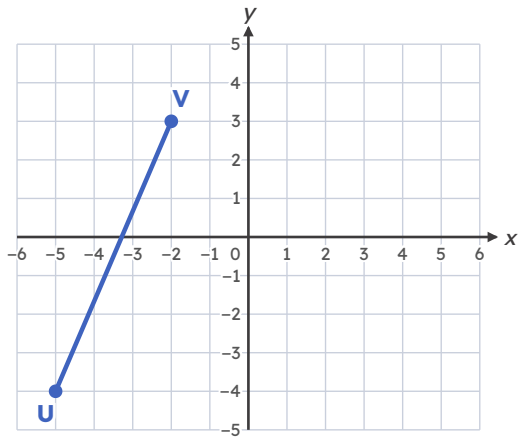

Rise = _____ Run = _____

9

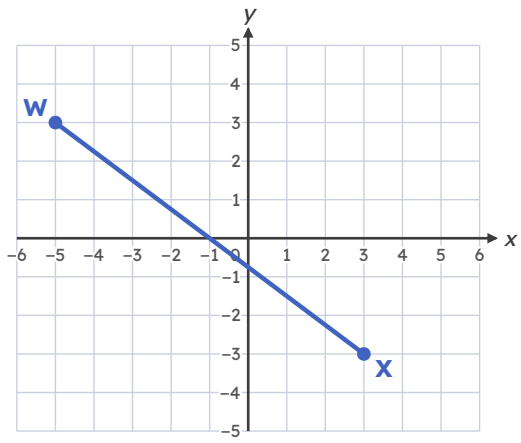

Rise = _____ Run = _____

10

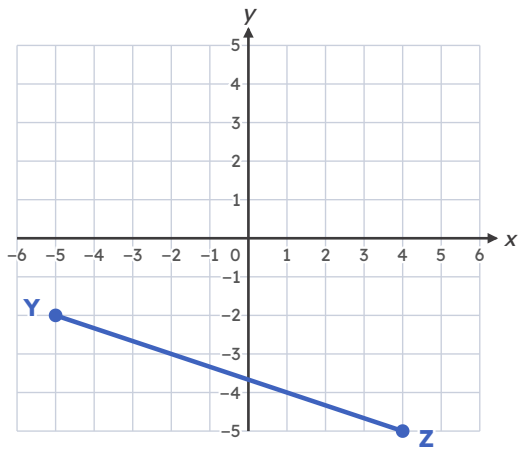

Rise = _____ Run = _____
